With Remotes

LP Gas Detection

WITH VALVE CONTROL

7600 SERIES

- Available for Propane or Methane.
 - Listed to UL 1484 for home and RV.
- Carries Canadian Standard Association (CSA) listing.
 - 110 volt operation.
 - Includes battery backup.
 - Many gas valve sizes available.
- One point or multiple point detection available.

CCI Controls, the leading manufacturer of residential and commercial detectors, offers this automatic gas shut-off system designed specifically for residential and commercial use. This system was developed because of the varying demands dictated by the residential and commercial user. It is particularly well-suited for below grade installations where city and state laws require its application. And this unit can instantly shut the dwelling's/building's gas service off by activating the detectors on/off switch.

The 7600 Series Kit includes:

Detector; valves (3/8" through 1-1/4"); battery; battery housing; valve driver; 110V AC adapter.

In the event of a community power outage, the service battery will provide a source of energy maintaining its operation up to 8 continuous hours. Should gas be detected at 20% of the lower combustible level of Propane or Methane, the alarm is sounded and the gas supply is shut off at the valve. The gas will remain off until the detector is manually reset.
